How Many Grams is 10 Tola of Gold?

Weight and Measurement Conversions · https://www.purejewels.com/faqs/weight-and-measurement-conversions/how-many-grams-is-10-tola-of-gold/

Ten tola of gold is 116.6 grams. The conversion is fixed: one tola equals 11.66 grams (11.6638g precisely), a standard set in British India in the 1830s and still used for gold bars, coins and bullion today. Multiply by ten, and you have 116.6 grams.

But the weight is only the starting point. Once you know that 10 tola is 116.6 grams, the more useful questions are what that gold is worth today and what it will actually buy. Here is how to work both out.

If you need to convert any tola figure quickly, use our Tola to Gram calculator.

Does 10 tola mean 116.6g or 100g?

Both figures are in use, and the difference matters when money is involved. For coins, bars and bullion, one tola is the formal 11.66 grams, so 10 tola is 116.6 grams. In everyday jewellery trade across India, Pakistan and Bangladesh, “tola” (or bori) is often rounded to 10 grams for ease, so “10 tola” is sometimes used loosely to mean 100 grams. At PureJewels, we keep the two apart: our gold and silver tola coins follow the formal 11.66g standard, while the gram weight is listed on every jewellery piece so you are never guessing. If a seller quotes you in tola, always ask how many grams they mean.

What is 10 tola of gold worth today?

To value 10 tola of 22ct gold, multiply 116.6 grams by today’s 22ct gold price per gram. That gives you the raw gold value, the metal on its own, before any making charge or VAT. You can check the current rate on our current gold price per gram page, or ask our team on Live Chat to confirm the day’s rate before you order. At today’s 22ct rate, 10 tola works out at roughly £11800 (as on 17th Sep 2026)˙

Two things change the price once gold is made into jewellery: the making charge, which is the goldsmith’s labour and rises with design complexity, and VAT at 20%. Investment gold is treated

differently again; gold bars are 24ct and VAT-exempt in the UK.

What can you buy with 10 tola of gold?

At 116.6 grams, 10 tola is a serious amount of gold, well into bridal and heirloom territory. In 22ct jewellery, this weight covers a heavy bridal necklace, a matched bangle set, or a substantial occasion piece meant to be kept and passed down. If your interest is in holding gold rather than wearing it, the same weight range is available as investment-grade 24ct gold bars, which carry only a small premium over the metal price and are VAT-exempt in the UK. Browse our 22ct gold jewellery collection for pieces to wear, or our gold bars for investment at this weight.

Why do people measure gold in tola instead of grams?

The tola is more than a unit of weight; it is the language families have used to talk about gold for generations. When a grandmother says she is giving five tola at a wedding, she is speaking in a measure her own mother and grandmother used, and everyone in the room knows exactly what she means. That continuity is part of what gold represents in South Asian families. On Green Street, we have served that community for over fifty years, so we speak in tola when our customers do, and we print the gram weight on every piece, so you can move between the two with confidence.

Once you know that 10 tola is 116.6 grams, put the number to work: check today’s 22ct rate, look at pieces in this weight range, and ask us for a full price breakdown on anything you are considering. Every PureJewels piece is hallmarked by the London Assay Office and listed with its exact gram weight.
